Titel des Papiers:

An Empirical Study of the Reliability of UNIX Utilities

Kurzzusammenfassung:

- frequently used parts expected to work
- verifying entire OS not doable
- test:
  1. Generate random chars
  2. test using chars
  3. note down strings causing crash
  4. find error and categorise
- 24% of UNIX programs crashable
- 3 results: Crash, Hang, Succeed
- method, does not claim being exhaustive
- not replacing but complementing other test methods
- Most problems caused by things already known to devs, need to stay vigilant
- Bugs often not reported but avoided
- Types of errors:
  - Pointer/Array Errors (pointer overflow, null pointer)
  - Faulty unchecked return codes
  - Input functions
  - Sub-Processes
  - Interaction Effects
  - Bad error handler
  - Signed Chars
  - Race Conditions
  - Undetermined

Eigene (offene) Diskussionspunkte:

- Timeframe?
- Does not verify correctness, viability?
- most errors linked to bad coding habits
