Information Visualization
Summer Semester 2026
Exercise Sheet 8

Group work: Please keep in mind that the exercises are meant to prepare you for the exam.
ChatBots: Use your own brain as much and as often as possible.

Exercise 1 (Nassi-Shneiderman, Jackson, CFG)

Consider a simple dice rolling game, in which you count the number of rolls until a six appears. Think about the needed game logic and create a Nassi-Shneiderman diagram, a Jackson diagram, and a control-flow graph for the game.

Exercise 2 (City Metaphor)

Think about a new use case for the city metaphor explained in the lecture (besides the static structure of software projects). Explain how you would display the information (mapping between data and streets, buildings, height of buildings, etc.) and provide a sketch of how your visualization would look like. Possible use cases can be related to requirements, deployment, or dynamic aspects, but use cases not related to software development are also welcome.
